

Biobarrier® Root Control System Adds Sizes

Biobarrier® Root Control Fabric has added two new sizes, a 24-inch x 20-foot roll and a 24-inch x 100-foot roll.

“Our work with landscape architects has made us aware that a 24-inch width would be a convenient size for some of their projects,” said Roger Bergh, Biobarrier Senior Sales Manager, “so we developed it in two lengths. The new sizes are available now.”

Biobarrier Root Control System is also available in 10 other sizes—12-inch x 20-foot rolls; 12-inch x 100-foot rolls; 19.5-inch x 20-foot rolls; 19.5-inch x 100-foot rolls, 29-inch x 20-foot rolls, 29-inch x 100-foot rolls, 39-inch x 20-foot rolls, 39-inch x 100-foot rolls, 58.5-inch x 20-foot rolls, and 58.5-inch x 100-foot rolls.

Biobarrier Root Control Fabric is a geotextile that was designed to slowly release trifluralin, a proven, non-systemic herbicide that works by creating a vapor zone that prevents root tip cell division. Trees concentrate growth in branch roots away from the trifluralin zone and any roots reaching the zone begin to grow away from it. Because it's porous to water and nutrients, Biobarrier Root Control System doesn't disturb soil hydrology.
